## ACSS® VULCAN™ RETICLE

The ACSS Vulcan Reticle is a revolutionary approach to mini reflex sights, improving user agility through a 'heads-up' target acquisition. Under duress, standard mini reflex reticles can be lost without proper sight alignment. With the ACSS Vulcan reticle, users always know the relative location of their aiming point, allowing for quick correction and improved accuracy on target.

## RETICLE FEATURES

The ACSS Vulcan reticle features a 10 MOA high chevron aiming point surrounded by a 250 MOA circle.

This circle indicates the relative position of the chevron when the sight is off-center. At an average arm's length (27"), the ACSS Vulcan will only show its chevron when properly aligned. If the sight is canted, the outer ring comes into view, guiding the user back to center. This eliminates the 'searching' problem on traditional dot reticles.

This optic features a multiple-reticle system, allowing the user to activate or deactivate the 250 MOA circle at their preference. This can be done by pressing and holding the "-" illumination button for 3 seconds.

NOTE: The gap at the bottom of the 250 MOA circle is normal. This notch is made for illumination purposes.

## HOW TO USE RETICLES

When the optic is slightly off-center, the outer ring comes into view, alerting the user to correct their alignment. The following images demonstrate the reticles appearance in different stages of alignment.

*Aimed too far right.*

*Aimed too far left.*

*Aimed too low.*

*Aimed too high.*

If only the ring is visible, the optic is far off center. Seeing the ring's curve, the user knows exactly where to shift, even under duress.

## BULLET DROP COMPENSATION BY CALIBER

The ACSS reticle is effective with a variety of calibers. Find the diagram that matches your firearm and sight it in at the distance indicated. Due to the wide variety of bullet loads and barrel lengths.
